

→ Convenciones:

```
# En todos los nodos como 'sudo su'.
[root@srv1 ~]# Solo en servidor 'srv1'→ como 'sudo su'.
[root@srv2 ~]# Solo en servidor 'srv2'→ como 'sudo su'.
```

→ Recursos: → 'defaults' → pacemaker:

```
[root@srv1 ~]# pcs resource defaults migration-threshold=5
```

Warning: Defaults do not apply to resources which override them with their own defined values
[root@srv1 ~]# pcs resource defaults resource-stickiness=10

Warning: Defaults do not apply to resources which override them with their own defined values

```
[root@srv2 ~]# pcs resource defaults failure-timeout=5
```

Warning: Defaults do not apply to resources which override them with their own defined values

. resource-stickiness: adds a sticky score for the resource on its current node. It helps avoiding a resource move back and forth between nodes where it has the same score.

. migration-threshold: this controls how many time the cluster tries to recover a resource on the same node before moving it on another one.

. failure-timeout is measured since the most recent failure. That is, older failures do not individually time out and lower the fail count. Instead, all failures are timed out simultaneously (and the fail count is reset to 0) if there is no new failure for the timeout period.

→ Ip → 'pgsql-vip' → Balanceada para: → 'team0':

```
[root@srv1 ~]# pcs resource create pgsql-vip ocf:heartbeat:IPAddr2 nic="team0"
ip=192.168.10.150 cidr_netmask=24 op monitor interval=30s
```

```
[root@srv1 ~]# pcs constraint location pgsql-vip prefers srv1.enermol.lan
[root@srv1 ~]# pcs constraint location
```

Location Constraints:

Resource: pgsql-vip

Enabled on:

Node: srv1.enermol.lan (score:INFINITY)

→ Desplegamos el clon → 'glusterd' → Cedemos el control de los montajes 'glusterFS' a 'pacemaker', para todos los servers que lo requieran y en modo 'cliente nativo' → 'fuse.glusterfs'.

```
[root@srv1 ~]# pcs resource create glusterd systemd:glusterd
```

```
[root@srv1 ~]# pcs resource clone glusterd
```

```
[root@srv1 ~]# pcs resource create glusterFS-srv1 ocf:heartbeat:Filesystem
device="srv1.enermol.lan:/repVol-01" directory="/srv/repVol-01/" fstype="glusterfs"
options="defaults"
```

```
[root@srv1 ~]# pcs constraint location glusterFS-srv1 prefers srv1.enermol.lan=INFINITY
```

```
[root@srv1 ~]# pcs resource create glusterFS-srv2 ocf:heartbeat:Filesystem
device="srv2.enermol.lan:/repVol-01" directory="/srv/repVol-01/" fstype="glusterfs"
options="defaults"
```

```
[root@srv1 ~]# pcs constraint location glusterFS-srv2 prefers srv2.enermol.lan=INFINITY
```

→ Desplegamos → 'postgresql' → El montaje de esta forma pretende evitar el diseño de un 'PAF' (postgres Active failover), diseñado ad-hoc para postgres, y en streaming puesto que las restricciones las evitará 'GlusterFS'. Este último será el responsable de evitar los split-brains. Confiamos por tanto en la selección de atributos extendidos en una capa inferior. Las BB. de DD. deben hacer su trabajo en otro nivel. No tiene ningún sentido buscar un testigo de réplica en una base de datos idénticamente replicada, puesto que el testigo sería siempre el mismo. Con lo cual la réplica no podría ser nunca fiable. Y provocaría errores de tockens sucesivos.

```
[root@srv1 ~]# pcs resource create postgresql systemd:postgresql  
[root@srv1 ~]# pcs constraint location postgresql prefers srv1.enermol.lan  
[root@srv1 ~]# pcs constraint colocation add pgsql-vip with postgresql score=+INFINITY  
[root@srv1 ~]# pcs constraint order set pgsql-vip postgresql sequential=false require-all=true
```

→ Desplegamos → 'http' → apache. Con las restricciones impuestas se balanceará a favor de la 'pgsql-vip'. De interés para un despliegue → 'pgadmin4'.

```
# vim /etc/httpd/conf.d/status.conf  
<Location /server-status>  
SetHandler server-status  
Order deny,allow  
Deny from all  
Allow from 127.0.0.1  
Allow from ::1  
</Location>
```

```
[root@srv1 ~]# pcs resource create apache ocf:heartbeat:apache  
configfile=/etc/httpd/conf/httpd.conf statusurl="http://localhost/server-status" op monitor  
interval=1min
```

```
[root@srv1 ~]# pcs constraint location apache prefers srv1.enermol.lan  
[root@srv1 ~]# pcs constraint order pgsql-vip then apache  
[root@srv1 ~]# pcs constraint colocation add apache with pgsql-vip score=+INFINITY
```

→ Configuración Actual del Cluster → 'cluster-odoo'

```
# pcs config  
Cluster Name: cluster-odoo  
Corosync Nodes:  
srv1.enermol.lan srv2.enermol.lan  
Pacemaker Nodes:  
srv1.enermol.lan srv2.enermol.lan
```
